

Use-Case Flow Specification

Use Case: Incident Escalation

Actors: On-Call Engineer, Incident Commander

1. Preconditions

- An incident alert has been received by the system.
- An active on-call engineer is available in the rotation schedule.
- The escalation mechanism is configured.

2. Postconditions

- The incident is acknowledged and assigned for handling, or
- If it is not acknowledged within 5 minutes, the incident is escalated to the next engineer.

3. Main Success Scenario

1. The system receives an incident alert.
2. The system identifies the active on-call engineer from the rotation schedule.
3. The system sends the incident alert to the active on-call engineer.
4. The on-call engineer acknowledges the incident within 5 minutes.
5. The engineer handles the incident.
6. The system records the incident status and outcome.

4. Alternate Flow

A1. On-Call Engineer Does Not Acknowledge

- If the engineer does not acknowledge the incident within 5 minutes, the system triggers escalation.
- The system routes the incident to the secondary/on-call engineer.
- The escalation event is recorded for tracking.

Basis: The problem statement specifies escalation to a secondary engineer when an incident is unacknowledged within 5 minutes.
